R-CNN Process

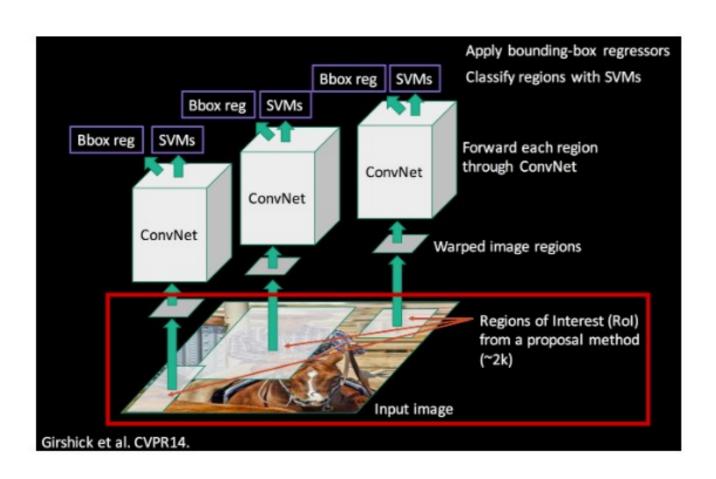

R-CNN: Regions with CNN features

16 May 2024

Region proposal(영역 제안)

• 물체가 있을 법한 영역

- 기존 모델 sliding window
- Selective Search

Sliding window

- 고정된 크기의 window
- 각 window 위치에서 CNN
- 느리다는 단점

Selective search

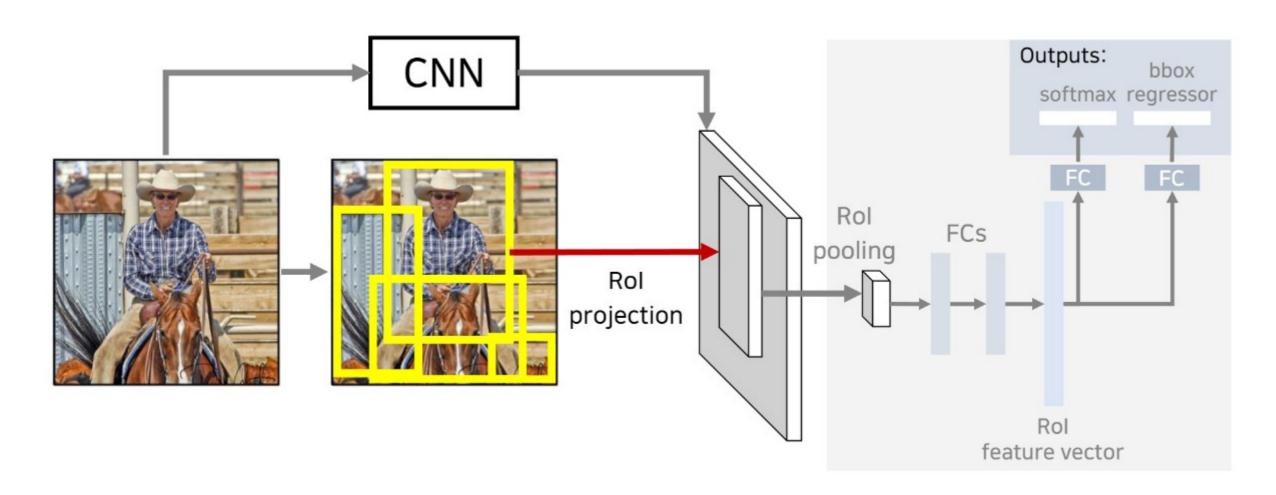

- 초기 분할
- 유사 영역 병합
- 지역 제안
- 객체 검출

R-CNN의 한계

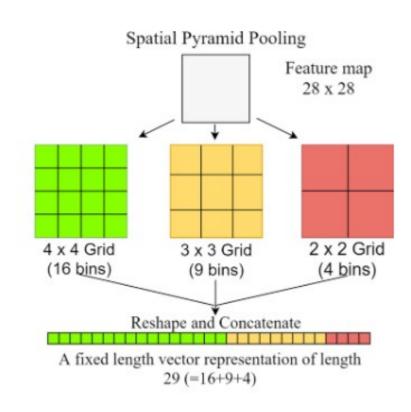

cpu 기반 Selective search 많은 시간 소요

Selective search로 추출한 RoI마다 개별 CNN연산(약 2000 * CNN)

SVM, Bounding Box Regressor가 CNN과 분리 CNN이 고정되므로, SVM, Bounding Box Regressor의 결과로 CNN을 업데이트할 수 없어서 end-to-end 방식으로 학습 불가

Rol pooling

SPP (Spatial Pyramid Pooling)

• Rol Pooling에 사용되는 알고리즘

• 4x4, 2x2, 1x1의 bin들을 가진 각각의 SPP Layer을 통과 후 Concatenate(1차원 특성 벡터)

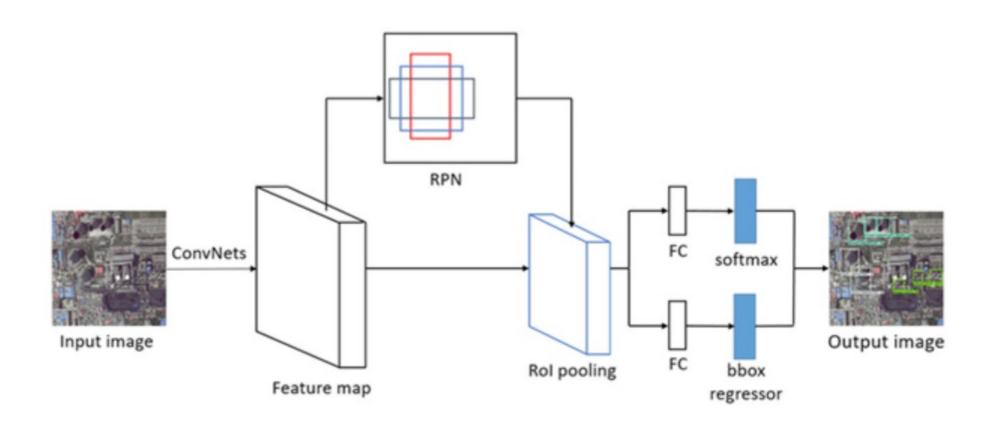

R-CNN과의 차이 및 한계

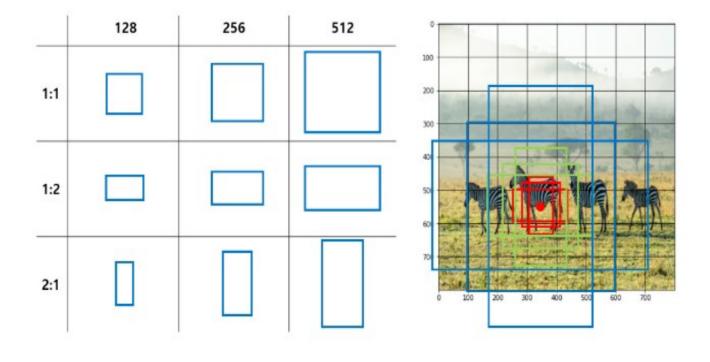

• 약 2000번의 CNN 연산을 한 번의 CNN 연산으로 바꿔 속도 향상

• 단일 손실 함수를 사용. Classification과 Bounding Box Regressor을 동시에 최적화

• 위의 이유로 end-to-end로 학습 가능

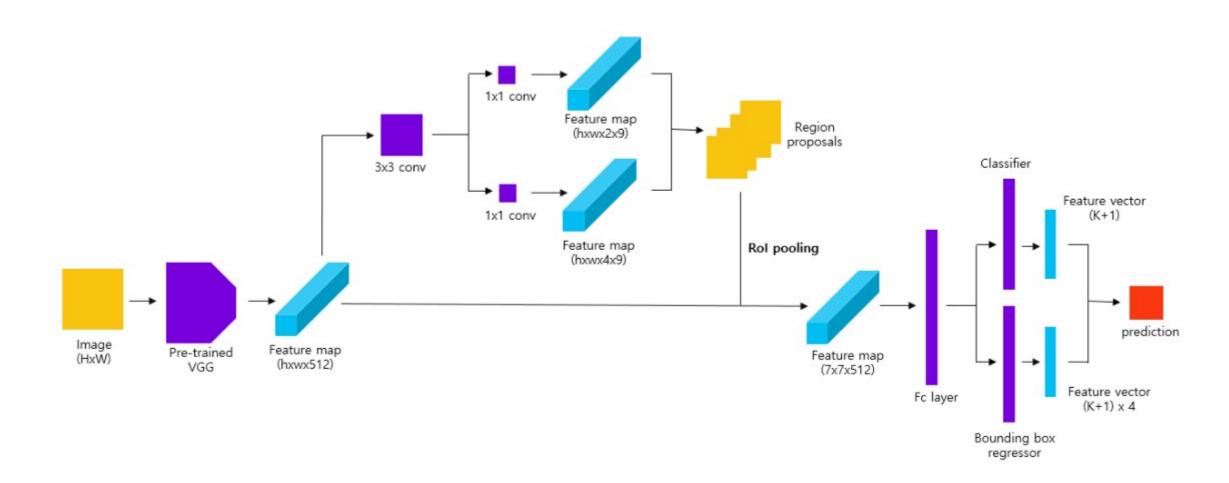

• 여전히 cpu 기반 selective search를 사용.

3가지 scale, ratio

각 그리드마다 9개의 anchor box 생성

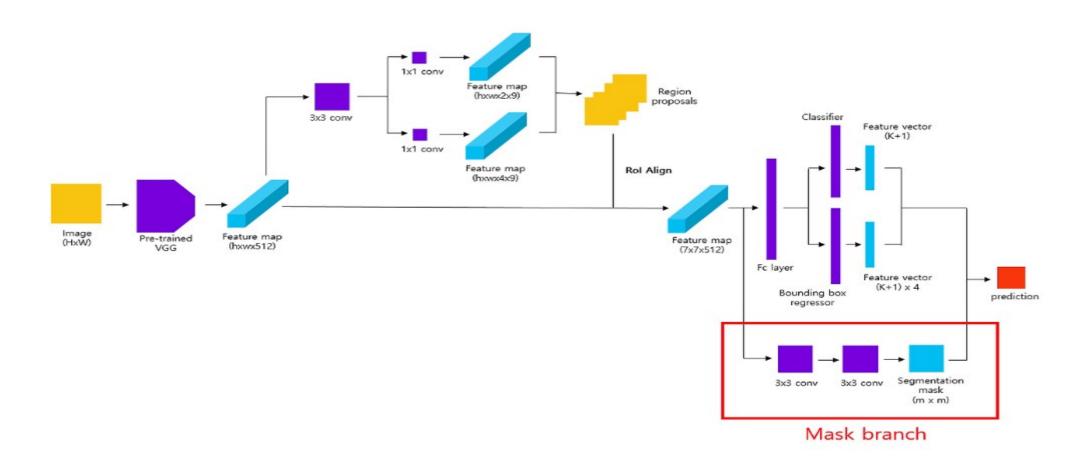

Fast R-CNN 차이점

• Selective Search 대신 RPN을 사용하여 region proposals 생성 속도 개선

• 동일한 CNN 특징 맵을 공유하여 연산 자원 효율 극대화

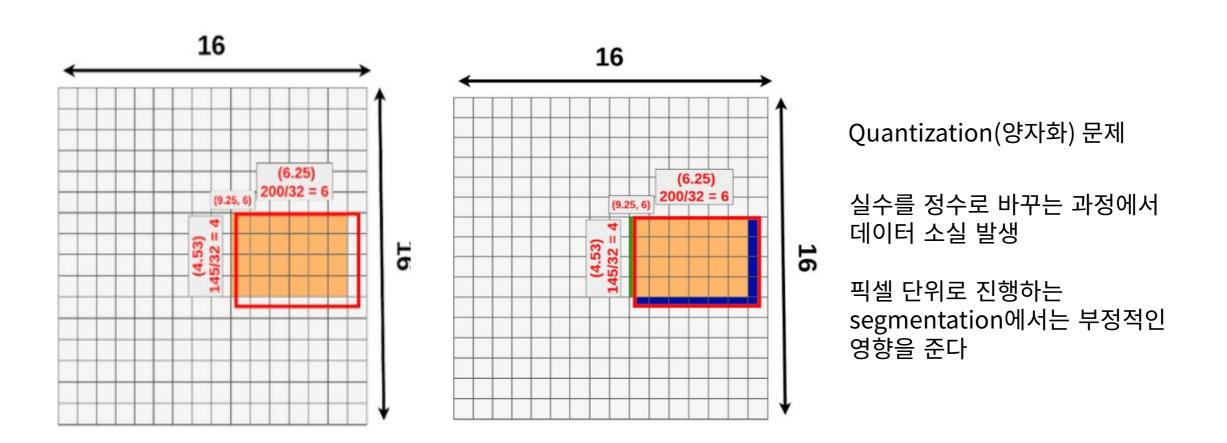

Mask R-CNN

Mask R-CNN

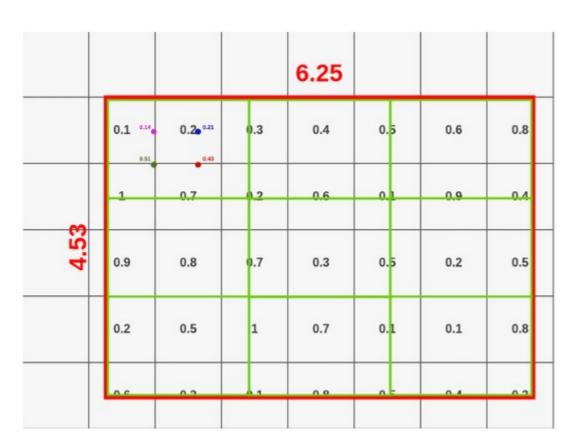

Rol Pooling에서 Rol Align으로 변경 Mask branch 추가

Rol Pooling의 문제점

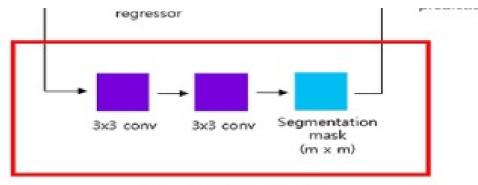

Rol Align

하나의 cell에 있는 4개의 sampling point에 대하여 max pooling

Mask branch

Mask branch

Base

Binary Mask

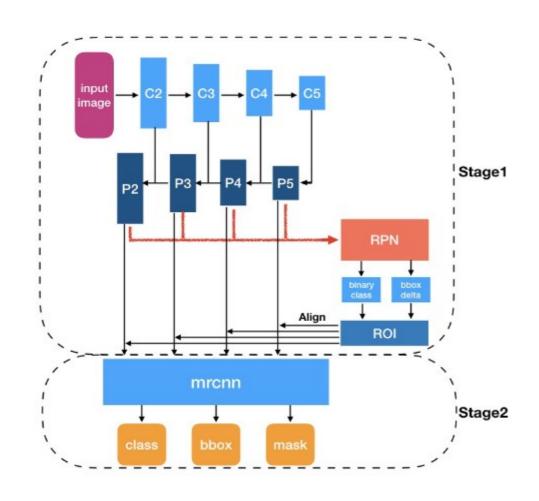

Binary mask

각각의 Rol에 작은 크기의 FCN이 추가된 형태

클래스 단위로 mask를 생성한 후 픽셀이 해당 클래스에 해당되는지 여부를 표시

FPN(Feature Pyramid Network)

다중 스케일 특성(Multi-scale Features)

정확한 객체 검출 및 분할

성능 향상

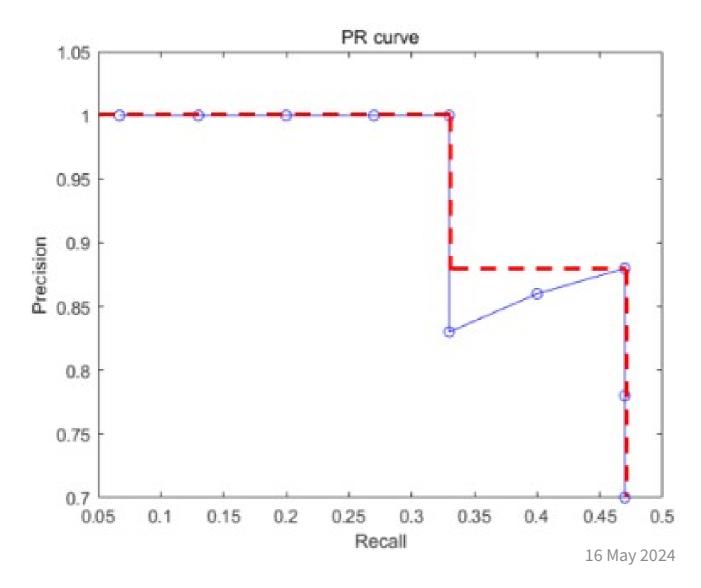

Mask R-CNN 결과

결과

	backbone	AP	AP_{50}	AP_{75}	AP_S	AP_M	AP_L
MNC [10]	ResNet-101-C4	24.6	44.3	24.8	4.7	25.9	43.6
FCIS [26] +OHEM	ResNet-101-C5-dilated	29.2	49.5	2	7.1	31.3	50.0
FCIS+++ [26] +OHEM	ResNet-101-C5-dilated	33.6	54.5	2	-	-	-
Mask R-CNN	ResNet-101-C4	33.1	54.9	34.8	12.1	35.6	51.1
Mask R-CNN	ResNet-101-FPN	35.7	58.0	37.8	15.5	38.1	52.4
Mask R-CNN	ResNeXt-101-FPN	37.1	60.0	39.4	16.9	39.9	53.5

Table 1. **Instance segmentation** *mask* AP on COCO test-dev. MNC [10] and FCIS [26] are the winners of the COCO 2015 and 2016 segmentation challenges, respectively. Without bells and whistles, Mask R-CNN outperforms the more complex FCIS+++, which includes multi-scale train/test, horizontal flip test, and OHEM [38]. All entries are *single-model* results.

평가 지표

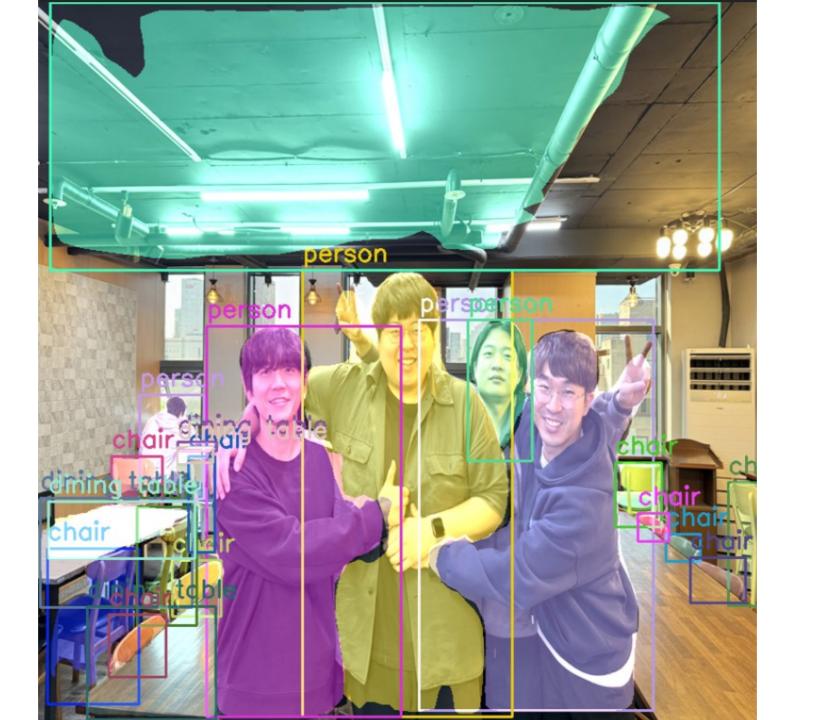

AP는 Precision-Recall 곡선 아래의 면적을 계산한 값

모델이 다양한 임계 값에서 얼마나 일관되게 높은 Precision과 Recall을 유지하는지를 평가합니다

코드 구현

```
def get_instance_segmentation_model(num_classes):
93
          # load an instance segmentation model pre-trained on COCO
          model = torchvision.models.detection.maskrcnn_resnet50_fpn(pretrained=True)
 95
 96
          # get the number of input features for the classifier
97
           in_features = model.roi_heads.box_predictor.cls_score.in_features
98
          # replace the pre-trained head with a new one
99
           model.roi_heads.box_predictor = FastRCNNPredictor(in_features, num_classes)
100
101
          # now get the number of input features for the mask classifier
102
           in_features_mask = model.roi_heads.mask_predictor.conv5_mask.in_channels
103
104
          hidden_layer = 256
105
          # and replace the mask predictor with a new one
           model.roi_heads.mask_predictor = MaskRCNNPredictor(in_features_mask,
106
107
                                                              hidden layer,
                                                              num_classes)
108
109
110
           return model
```
